so $D_i F(a)$ is simply the result of differentiating F as a function of the single variable x_i , holding the remaining variables fixed. Example 1 If $f(x, y) = xy$, then $D_1 f(x, y) = y$ and $D_2 f(x, y) = x$. If $g(x, y) = e^x \sin y$, then $D_1 g(x, y) = e^x \sin y$ and $D_2 g(x, y) = e^x \cos y$. To return to the matter of the tangent plane to S at $F(a)$, note that

Advanced Calculus. This rigorous two-part treatment advances from functions of one variable to those of several variables. Intended for students who have already completed a one-year course in elementary calculus, it defers the introduction of functions of several variables for as long as possible, and adds clarity and simplicity by avoiding a mixture of heuristic and rigorous arguments.
