Brake specific fuel consumption (BSFC) is a parameter that reflects the efficiency of a combustion engine which burns fuel and produces rotational power (at the shaft or crankshaft). In automotive applications, BSFC is used to evaluate the efficiency of the internal combustion engines (ICE). The keyword "brake" is related to the use of a dynamometer (electrical brake) to measure the engine parameters (fuel mass flow rate, torque, etc.).

Brake-specific fuel consumption is a measure of the fuel efficiency of any prime mover that burns fuel and produces rotational, or shaft power. It is typically used for comparing the efficiency of internal combustion engines with a shaft output. It is the rate of fuel consumption divided by the power produced. It may also be thought of as power-specific fuel consumption, for this reason. BSFC allows the fuel efficiency of different engines to be directly compared.

15.3.4.2 Brake specific fuel consumption. BSFC is a measure of the fuel efficiency of any engine that burns fuel and produces rotational power output. The BSFC value indicates how efficiently the engine converts fuel supplied into useful work. One of the main parameters used to determine the characteristics of biodiesel on BSFC is calorific value.

When considering the bsfc values, the tested engine produced a low of 215.3 g/kWh at 2000rpm and a peak of 277.4 g/kWh at 1000rpm. The curve shows a relatively strong decline from 1000-2000rpm then a slow rise after that. Compared to the Toyota and Honda engines spoken of before, they achieved values of ~220 and 230 respectively.

Brake Thermal Efficiency And Bsfc Of Diesel Engines

Brake specific fuel consumption, abbreviated BSFC and also known by the term power-specific fuel consumption or simply specific fuel consumption, is a type of comparison ratio which looks at an engine's fuel efficiency in terms of how much fuel the car uses versus how much power it produces.

What is Brake Specific Fuel Consumption? (with picture)

Brake specific fuel consumption: The literal meaning of bsfc is how much fuel is consumed in one hour to produce one kilowatt brake power (i.e. power available at engine shaft not power produced into engine block). It is used to measure fuel efficiency and also to compare internal combustion engines on basis of shaft power.
