The best solution to solve this overload situation is to run a dedicated circuit to the biggest load. In practice, to avoid high installation costs, professional electricians run new circuits to the appliances they can reach most easily.

Preventing Electrical Overloads | Family Handyman

As discussed above, the first step is to simplify the circuit by replacing the two parallel resistors with a single resistor that has an equivalent resistance. Two 8 Ω resistors in series is equivalent to a single 4 Ω resistor. Thus, the two branch resistors (R 2 and R 3) can be replaced by a single resistor with a resistance of 4 Ω.

You can use your graphing calculator or matrix software to give you the mesh currents: With these calculated mesh currents, you can find the device currents: i1 = iA = 0.8 mA. i2 = iA - iB = 0.8 mA - (-0.6 mA) = 1.4 mA. To complete the analysis, plug the device currents and resistances into the Ohm's law equations.

The current in an inductive circuit is given by 0.3 sin (200t - 40°) A. Write the equation for the voltage across it if the inductance is 40 mH. Solution. L = 40 × 10⁻³ H; i = 0.1 sin (200t - 40°) X L = ωL = 200 × 40 × 10⁻³ = 8 Ω. V m = I m X L = 0.3 × 8 = 2.4 V. In an inductive circuit, the voltage leads the current by 90o Therefore,
