The Mathematics Of Lottery Odds

The author frequently makes the statement, "from a mathematical point of view, any number has the same probability of occurrence in a draw as any other" and makes no pretense of knowing any special technique or strategy of how to win, just the probabilities of a number being drawn, which for a lottery player, is a useless bit of information since "any number has the same probability of occurrence in a draw as any other".

If the powerball is drawn from a pool of numbers different from the main lottery, the odds are multiplied by the number of powerballs. For example, in the 6 from 49 lottery, given 10 powerball numbers, then the odds of getting a score of 3 and the powerball would be 1 in  $56.66 \times 10$ , or 566.6 (the probability would be divided by 10, to give an exact value of  $\frac{8815}{4994220}$  ).

The odds for winning a lottery prize are based on formulas considered "lottery mathematics", which determine your chances of matching the numbers drawn. Formulas for calculating lottery odds and jackpot odds are a bit complicated. (Formulas for the calculation of lottery jackpots are also complicated, but that's a different story.) Lottery odds and jackpot odds take into account how many numbers there are in total; how many of them are selected in each draw; and whether there is an ...
